Compaction puzzle

There are 9 tokens on a grid. Can we reconfigure them into a square box by pushing them from the sides?

Problem: Given n tokens, can we push them into an $a \times b$ box?

Compaction puzzle

There are 9 tokens on a grid. Can we reconfigure them into a square box by pushing them from the sides?

Problem: Given n tokens, can we push them into an $a \times b$ box?

Sparse configurations

What if the configuration is “*sparse*”, i.e., no row or column has more than one token? Forming a square may still be impossible:

Compaction puzzle: Previous results

Essentially one paper:

H. Akitaya, G. Aloupis, M. Löffler, and A. Rounds
“Trash compaction”, in *Proceedings of EuroCG 2016*

Theorem

Deciding if tokens can be pushed into an $a \times b$ box is NP-complete.

Theorem

Given $2n$ tokens that occupy k rows, deciding if they can be pushed into an $n \times 2$ box is an XP problem (with parameter k). Specifically, it can be solved in $O(n)$ time if $k \leq 3$ and in $O(n^{2(k-2)})$ time if $k > 3$.

Open problem

Is there a sparse configuration of $n = 9$ tokens that cannot be pushed into a 3×3 square?

Pushing sparse configurations into boxes

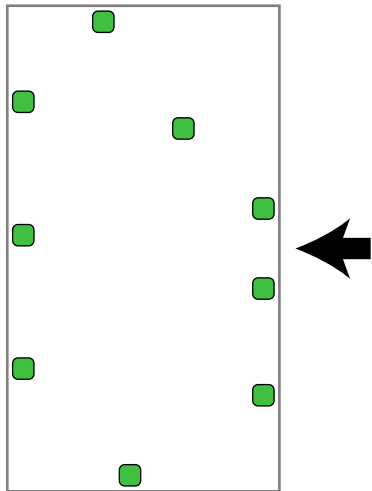

There is an algorithm for pushing 9 tokens into a 3×3 square.

Pushing sparse configurations into boxes

Step 1: Push right until 3 "side tokens" become aligned.

Pushing sparse configurations into boxes

Step 2: Push left until 3 "side tokens" become aligned.

Pushing sparse configurations into boxes

Identify the side (up or down) with fewer “middle tokens”.

Pushing sparse configurations into boxes

Step 3: Push from that side until 3 tokens become aligned.

Pushing sparse configurations into boxes

Step 4: Push up/down as far as possible without aligning 4 tokens.

Pushing sparse configurations into boxes

Step 4: Push up/down as far as possible without aligning 4 tokens.

Pushing sparse configurations into boxes

Now the tokens occupy exactly 3 consecutive rows.

Pushing sparse configurations into boxes

Step 5: Push all the way to the left to form a 3×3 square.

Pushing sparse configurations into boxes

Forming an $n \times 1$ box is easy: simply push down and then right.

Pushing sparse configurations into boxes

Forming an $n \times 1$ box is easy: simply push down and then right.

Pushing sparse configurations into boxes

Forming an $n \times 1$ box is easy: simply push down and then right.

Pushing sparse configurations into boxes

Given $2n$ tokens, forming an $n \times 2$ box is easy, too.

Pushing sparse configurations into boxes

Given $2n$ tokens, forming an $n \times 2$ box is easy, too.

Pushing sparse configurations into boxes

Given $2n$ tokens, forming an $n \times 2$ box is easy, too.

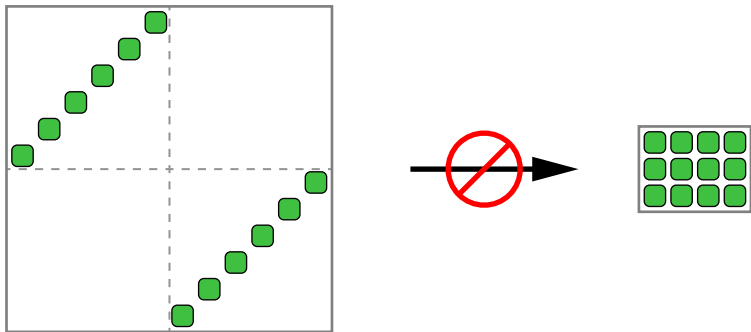

Pushing sparse configurations into boxes

Given $2n$ tokens, forming an $n \times 2$ box is easy, too.

Pushing sparse configurations into boxes

In all other cases, i.e., when $a \geq 4$ and $b \geq 3$, there are sparse configurations of $n = ab$ tokens that cannot form an $a \times b$ box:

Theorem

All sparse configurations of $n = ab$ tokens can be pushed into an $a \times b$ box if and only if $a \leq 2$ or $b \leq 2$ or $a = b = 3$.

Uncompressible configurations

From now on, we will focus on *uncompressible* configurations, i.e., where the bounding box contains a full row and a full column.

Uncompressible configurations

In such configurations, pushing the bounding box in one direction is equivalent to letting tokens “fall” in the opposite direction.

Uncompressible configurations

In such configurations, pushing the bounding box in one direction is equivalent to letting tokens “fall” in the opposite direction.

Uncompressible configurations

In such configurations, pushing the bounding box in one direction is equivalent to letting tokens “fall” in the opposite direction.

Uncompressible configurations

In such configurations, pushing the bounding box in one direction is equivalent to letting tokens “fall” in the opposite direction.

Uncompressible configurations

After a few moves, the configuration tends to become orthogonally convex, where each row (resp. column) of length k is contained in the projection of every row (resp. column) of length $\geq k$.

We call such a configuration *compact*.

Uncompressible configurations

Without loss of generality, we will assume the configuration to be a compact “staircase” with a full leftmost column and a full bottommost column. We call such a configuration *canonical*.

Gravity puzzle

Let us assign unique labels to the tokens. After playing some moves and restoring a canonical configuration, we obtain a permutation of these tokens.

Gravity puzzle

Problem: What are the possible configurations of this puzzle?

Note: The set of possible permutations is closed under composition, and therefore is a *permutation group*.*

*For *finite* sets of permutations, closure under composition is sufficient.

Gravity puzzle: Permutations are even

1	2	3	1	2	3	4	5	6
4	5	6	7	8	9	10	11	12
7	8	9	10	11	13	14	15	16
12	13	14	15	16	17	18	17	18
19	20	21	22	23	24	25	19	20
26	27	28	29	30	31	32	33	34
35	36	37	38	39	40	41	42	43

We will prove that any permutation obtainable in this puzzle must be even. It will be convenient to label the empty cells, too.

Gravity puzzle: Permutations are even

6	1	2	3	1	2	3	4	5
12	4	5	6	7	8	9	10	11
16	7	8	9	10	11	13	14	15
18	12	13	14	15	16	17	18	17
20	19	20	21	22	23	24	25	19
26	27	28	29	30	31	32	33	34
35	36	37	38	39	40	41	42	43

Every move causes a cyclic permutation on some rows or columns, involving both labeled tokens and labeled empty cells.

Gravity puzzle: Permutations are even

5	6	1	2	3	1	2	3	4
11	12	4	5	6	7	8	9	10
15	16	7	8	9	10	11	13	14

19	20	19	20	21	22	23	24	25
26	27	28	29	30	31	32	33	34
35	36	37	38	39	40	41	42	43

Every move causes a cyclic permutation on some rows or columns, involving both labeled tokens and labeled empty cells.

Gravity puzzle: Permutations are even

4	5	6	1	2	3	1	2	3
10	11	12	4	5	6	7	8	9
14	15	16	7	8	9	10	11	13
17	18	12	13	14	15	16	17	18
19	20	19	20	21	22	23	24	25
26	27	28	29	30	31	32	33	34
35	36	37	38	39	40	41	42	43

Every move causes a cyclic permutation on some rows or columns, involving both labeled tokens and labeled empty cells.

Gravity puzzle: Permutations are even

10	11	12	1	2	3	7	8	9
14	15	16	4	5	6	10	11	13
17	18	12	7	8	9	16	17	18
19	20	19	13	14	15	23	24	25
26	27	28	20	21	22	32	33	34
35	36	37	29	30	31	41	42	43
4	5	6	38	39	40	1	2	3

Every move causes a cyclic permutation on some rows or columns, involving both labeled tokens and labeled empty cells.

Gravity puzzle: Permutations are even

Recall that all rows of the same length must always be aligned. Moreover, for every move that pushes all rows of some length to the right, there must be a move that pushes all of them to the left.

Gravity puzzle: Permutations are even

The same holds for columns and up/down moves. Thus, if we decompose every move into cycles (involving both tokens and empty cells), we see that every cycle must have a matching cycle of the same length.

Gravity puzzle: Permutations are even

So, if we restore a canonical configuration, the overall permutation must be even. We still need to prove that the same permutation, restricted to the tokens (equiv., to the empty cells), is also even.

Gravity puzzle: Primal and dual puzzles

1	2	1	2	3	4	5	6	7
3	4	8	9	10	11	12	13	14

32	33	35	45	19	20	39	22	23

As we play the primal puzzle, we are also playing the dual puzzle.

Gravity puzzle: Primal and dual puzzles

The rules of the dual puzzle are slightly different: in a left move, only the rows that are farthest from the left margin are pushed, etc.

Gravity puzzle: Primal and dual puzzles

The rules of the dual puzzle as slightly different: in a left move, only the rows that are farthest from the left margin are pushed, etc.

Since the dual puzzle is smaller than the primal, we can conclude by induction that the permutation restricted to each puzzle is even.

2-transitive groups

We have proved that only even permutations of the tokens are possible. Can we obtain *all* even permutations?

Definition

A permutation group G on $\{1, 2, \dots, n\}$ is *2-transitive* if, for every $1 \leq x, y, w, z \leq n$ with $x \neq y$ and $w \neq z$, there is a permutation $\pi \in G$ such that $\pi(x) = w$ and $\pi(y) = z$.

Theorem (Jones, 2014)

If a 2-transitive permutation group G on n items contains a cycle of length $n - 3$ or less, then G contains all even permutations.

2-transitive groups

Lemma

Let $\alpha = (1, \dots, 2a + b + 1, 3a + b + 2, \dots, 3a + 2b + 1)$ and $\beta = (a + 1, \dots, a + b, 2a + b + 2, \dots, 4a + 2b + 2)$ be two cycles spanning $n = 4a + 2b + 2$ items, with $a \geq 0$ and $b \geq 1$. Then, α and β generate a 2-transitive permutation group on the n items.

(Example with $a = 2$ and $b = 4$.)

2-transitive groups

Lemma

Let $\alpha = (1, \dots, 2a + b + 1, 3a + b + 2, \dots, 3a + 2b + 1)$ and $\beta = (a + 1, \dots, a + b, 2a + b + 2, \dots, 4a + 2b + 2)$ be two cycles spanning $n = 4a + 2b + 2$ items, with $a \geq 0$ and $b \geq 1$. Then, α and β generate a 2-transitive permutation group on the n items.

Assume WLOG that tokens x and y are adjacent along β .

2-transitive groups

Lemma

Let $\alpha = (1, \dots, 2a + b + 1, 3a + b + 2, \dots, 3a + 2b + 1)$ and $\beta = (a + 1, \dots, a + b, 2a + b + 2, \dots, 4a + 2b + 2)$ be two cycles spanning $n = 4a + 2b + 2$ items, with $a \geq 0$ and $b \geq 1$. Then, α and β generate a 2-transitive permutation group on the n items.

It is easy to put x and y on distinct cycles.

2-transitive groups

Lemma

Let $\alpha = (1, \dots, 2a + b + 1, 3a + b + 2, \dots, 3a + 2b + 1)$ and $\beta = (a + 1, \dots, a + b, 2a + b + 2, \dots, 4a + 2b + 2)$ be two cycles spanning $n = 4a + 2b + 2$ items, with $a \geq 0$ and $b \geq 1$. Then, α and β generate a 2-transitive permutation group on the n items.

If their destinations are not on the same cycle, we simply shift them along each cycle the appropriate number of times.

2-transitive groups

Lemma

Let $\alpha = (1, \dots, 2a + b + 1, 3a + b + 2, \dots, 3a + 2b + 1)$ and $\beta = (a + 1, \dots, a + b, 2a + b + 2, \dots, 4a + 2b + 2)$ be two cycles spanning $n = 4a + 2b + 2$ items, with $a \geq 0$ and $b \geq 1$. Then, α and β generate a 2-transitive permutation group on the n items.

If their destinations are both on α , we put y at the appropriate distance along α , and then we shift x into α .

2-transitive groups

Lemma

Let $\alpha = (1, \dots, 2a + b + 1, 3a + b + 2, \dots, 3a + 2b + 1)$ and $\beta = (a + 1, \dots, a + b, 2a + b + 2, \dots, 4a + 2b + 2)$ be two cycles spanning $n = 4a + 2b + 2$ items, with $a \geq 0$ and $b \geq 1$. Then, α and β generate a 2-transitive permutation group on the n items.

If their destinations are both on α , we put y at the appropriate distance along α , and then we shift x into α .

2-transitive groups

Lemma

Let $\alpha = (1, \dots, 2a + b + 1, 3a + b + 2, \dots, 3a + 2b + 1)$ and $\beta = (a + 1, \dots, a + b, 2a + b + 2, \dots, 4a + 2b + 2)$ be two cycles spanning $n = 4a + 2b + 2$ items, with $a \geq 0$ and $b \geq 1$. Then, α and β generate a 2-transitive permutation group on the n items.

Finally, we shift x and y along α the appropriate number of times.

2-transitive groups

Lemma

Let G be a 2-transitive permutation group on a set A , and let β be a cycle spanning a set B , where $A \cap B \neq \emptyset$ and $A \setminus B \neq \emptyset$. Then, G and β generate a 2-transitive permutation group on $A \cup B$.

Assume WLOG that $x \in A \setminus B$ and $y \in A \cap B$.

2-transitive groups

Lemma

Let G be a 2-transitive permutation group on a set A , and let β be a cycle spanning a set B , where $A \cap B \neq \emptyset$ and $A \setminus B \neq \emptyset$. Then, G and β generate a 2-transitive permutation group on $A \cup B$.

If their destinations are both in A , we move them via G .

2-transitive groups

Lemma

Let G be a 2-transitive permutation group on a set A , and let β be a cycle spanning a set B , where $A \cap B \neq \emptyset$ and $A \setminus B \neq \emptyset$. Then, G and β generate a 2-transitive permutation group on $A \cup B$.

If the destination of x is in A and the destination of y is in $B \setminus A$, we first move y via β and then x via G .

2-transitive groups

Lemma

Let G be a 2-transitive permutation group on a set A , and let β be a cycle spanning a set B , where $A \cap B \neq \emptyset$ and $A \setminus B \neq \emptyset$. Then, G and β generate a 2-transitive permutation group on $A \cup B$.

If both destinations are in $B \setminus A$, we first move y at the appropriate distance along β , and then we move x within A .

2-transitive groups

Lemma

Let G be a 2-transitive permutation group on a set A , and let β be a cycle spanning a set B , where $A \cap B \neq \emptyset$ and $A \setminus B \neq \emptyset$. Then, G and β generate a 2-transitive permutation group on $A \cup B$.

Finally, we shift x and y along β the appropriate number of times.

Gravity puzzle: Generating cycles

The sequence of moves $R^k RULDL^k$, with $k \geq 0$, generates a family of cycles spanning all the full rows.

Gravity puzzle: Generating cycles

The sequence of moves $R^k RULDL^k$, with $k \geq 0$, generates a family of cycles spanning all the full rows.

Gravity puzzle: Generating all even permutations

By our first lemma, these two cycles determine a 2-transitive permutation group acting on the tokens they span.

Gravity puzzle: Generating all even permutations

By our first lemma, these two cycles determine a 2-transitive permutation group acting on the tokens they span.

Gravity puzzle: Generating all even permutations

By our second lemma, we can extend this set to the tokens spanned by the next cycle.

Gravity puzzle: Generating all even permutations

Proceeding in this fashion, we conclude that our cycles act 2-transitively on all the tokens they span.

Gravity puzzle: Generating all even permutations

Thus, by Jones' theorem, we can generate all even permutations on the tokens spanned by our cycles.

Gravity puzzle: Unmovable core

1	2	3	4	5	6	7			
8	9	10	11	12	13	14	15	16	
17	18	19	20	21	22	23	24	25	
26	27	28	29	30	31	32	33	34	35
36	37	38	39	40	41	42	43	44	45
46	47	48	49	50	51	52	53	54	55
56	57	58	59	60	61	62	63	64	65
66	67	68	69	70	71	72	73	74	75
76	77	78	79	80	81	82	83	84	85

In general, if more than half of the rows and more than half of the columns are full, there is a *central core* that is impossible to move.

Gravity puzzle: Unmovable core

	8	1	2	3	4	5	6	7	16
	17	9	10	11	12	13	14	15	25
26	27	18	19	20	21	22	23	24	35

Gravity puzzle: Special cases

1	2	3	4	5	6	7	
8	9	10	11	12	13	14	15
16	17	18	19	20	21	22	23
24	25	26	27	28	29	30	31
32	33	34	35	36	37	38	39
40	41	42	43	44	45	46	47
48	49	50	51	52	53	54	55

An exception is when there is exactly one empty cell. In this case, the permutation group is easily seen to be cyclic.

Gravity puzzle: Special cases

An exception is when there is exactly one empty cell. In this case, the permutation group is easily seen to be cyclic.

Gravity puzzle: Special cases

The only other exception is the puzzle with a 4×2 bounding box and two empty cells. In this case, the permutation group has order 60 and is isomorphic to A_5 .

Gravity puzzle: Non-unique labels

In this puzzle, since the core is empty and some tokens are equal, *all* permutations of the tokens are possible.

Conclusion and open problems

Theorem (Sparse configurations)

All sparse configurations of $n = ab$ tokens can be pushed into an $a \times b$ box if and only if $a \leq 2$ or $b \leq 2$ or $a = b = 3$.

Open problem

Is it NP-complete to decide whether a given sparse configuration can be pushed into a given rectangle?

Theorem (Reconfiguration)

If the configuration is compact, then the possible permutations are:

- *If exactly one cell is empty, the cycles of the non-core tokens.*
- *If there are 6 tokens and 2 empty cells, a group isomorphic to A_5 .*
- *Otherwise, if all non-core tokens are distinct, all the even permutations of the non-core tokens.*
- *Otherwise, all permutations of the non-core tokens.*

Open problem

What if the tokens form a non-compact configuration?
